

TOPIC 9 — AI Real Estate Property Listing Writer

Assessment Submission & Validation Report

Project

Property Listing Writer Workspace

A project workspace to convert raw property specs into buyer-focused narratives, title options, highlights, and CTAs.

Project Configuration

The workspace uses three reference sources covering real-estate listing copy rules and style guidelines, property listing templates and examples, and test cases with a validation checklist. Custom instructions define the professional real-estate copywriter role, factuality controls, structured output, missing-data rules, renovation framing, cliché avoidance, and restrictions on mortgage and property-tax estimates.

Required Output

- Title Options — exactly 3 short, catchy headlines.
- Narrative — exactly 2 paragraphs and under 250 words.
- Quick Highlights — concise bullets covering available neighborhood, specifications, price, and notable features.
- CTA — one closing sentence prompting a viewing or tour.

Validation Results

Test	Scenario	Result
1	Complete property data	PASS
2	Missing price + renovation needed	PASS
3	Repeated input consistency	PASS

Test Evidence

Complete-data input: Greenwood, Single-family, 3 bedrooms, 2 bathrooms, large deck, \$400k. The generated output contained 3 title options, a two-paragraph narrative, highlights, and a CTA without inventing unsupported local details.

Missing-price + renovation input: Greenwood, Single-family, 3 bedrooms, 2 bathrooms, 1,850 sq ft, large deck, needs renovation. The generated output omitted the missing price and used positive renovation framing without inventing upgrades.

Consistency test: The complete-data input was run again. Core facts and the required four-part structure remained consistent while wording varied naturally.

Deliverables

Challenges, Resolution & Limitations

The main challenge was ensuring the writer remained persuasive without fabricating missing property or neighborhood information. This was addressed with explicit factuality gates, missing-price handling, specification placeholders, renovation-positive framing, and a final quality check. The system is intentionally limited to supplied facts and project sources; it does not estimate mortgages, property taxes, or unsupported local amenities.

Assessment Alignment

The project demonstrates the required project setup, reference-source configuration, custom system instructions, structured four-part output, missing-data handling, positive renovation reframing, factuality controls, cliché avoidance, complete and missing-data scenarios, and repeated-run consistency.
